70% faster payouts incentive cycle cut from 10 days to 3 days	~30 min/hr → 0 manual work removed from every hourly report	6 workflows manual processes automated across sales and finance	233+ centres led NEET PG campaign with 60 BDMs and 10 CHs
--	--	--	--

PROFESSIONAL SUMMARY

Data Analyst with 1+ year of experience building **Python applications, automated reporting pipelines and interactive dashboards** for senior leadership. At Unacademy (PrepLadder), I cut the incentive payout cycle from 10 days to 3, removed ~30 minutes of manual work from every hourly report and automated 6 recurring manual workflows. I turn stakeholder requirements into reusable tools using modular Python, SQL, data modelling, run-rate forecasting and workforce/incentive analytics, and use **AI-assisted development** to ship faster.

WORK EXPERIENCE

Unacademy (PrepLadder) <i>Data Analyst – PMO & Strategy</i>	Bengaluru, India <i>Jun 2026 – Present</i>
Cut the incentive payout cycle by 70% (10 days → 3 days): built an Apps Script and OCR workflow that reads Student Ambassador KYC documents, verifies them, calculates each payout and sends Finance a payout report with verification status, replacing manual document checks. Removed ~30 min of manual work from every hourly report: replaced download-clean-format-screenshot-send with an 8-module Python package (config, data-access, formatting, delivery, orchestration) with pre-send validation, logging and an overlap guard; reports reach 50+ BDMs, 10 CHs, VP Sales, CBO and CEO every hour with zero manual touch. Automated 6 recurring manual workflows (hourly sales report, KYC and payout, daily lead distribution, hourly calling summary, spot-incentive reports, SA campaign updates) in Python and Apps Script, each with validation, backups or logs so stakeholders get outputs without rework. Moved reviews from month-end to mid-month: built run-rate forecasts (CRR, RRR, month-end projection) with pace flags for anyone below 85% of target, and an incentive model (70% revenue, 15% lead, 15% SA-activation achievement → slab → payout) for 50+ BDMs and 10 CHs. Stopped overstated numbers reaching leadership: modelled 80K+ rows from 3 source databases into fact and master tables, and caught 72% of conversions (635 of 888) lacking a valid signup, a 39% gap between summed and business targets (₹3.75 Cr vs ₹2.7 Cr) and ~10% of dates with day/month swapped. Workforce (people) analytics: maintain the employee master for 50+ BDMs and 10 CHs (joiners, leavers, status), apply the current hierarchy to all history so moves and exits roll up correctly, and normalised a 57 → 69 headcount change to compare incentive outcomes across months. Led the NEET PG offline lead campaign end to end across 233+ exam centres with 60 BDMs and 10 CHs: lead-collection templates, logistics, reimbursement verification, lead consolidation and de-duplication, BDM-wise distribution, and status and follow-up tracking to conversion.	

ODA Class <i>Data Analyst</i>	Bengaluru, India <i>Jun 2025 – Mar 2026</i>
- Cut cost per lead by 32% (₹675 → ₹457) through campaign data analysis; tracked 200–300 weekly leads at 6%+ conversion (₹2.4L–₹3.6L weekly revenue). - Used drop-off analysis to launch a program that scaled to 2,000+ students per session with 42% retention.	

PROJECTS (SELF-INITIATED)

BD Analytics Dashboard – Apps Script web app (HTML/CSS/JS): one data source feeding role-based views, an 8-view management dashboard (input, output, SA, territory, visits, portfolio, comparison, add-on) and a partitioned CH view, replacing the manually shared Performance Tracker and duplicate trackers per audience. Sales CRM – Google Sheets + Apps Script (process design): designed a lead → dial → connect → paid workflow with mandatory follow-up dates, script-owned vs editable columns and a daily upsert that never overwrites call notes, giving each BDM one prioritised list. Sales Analytics Toolkit – Python, Panel, OOP (GitHub): reusable analytical framework with data validation, funnel, run-rate and incentive classes, maintainable, documented code with 6 unit tests, and an interactive Panel dashboard surfacing insights on synthetic data.
